SUSTAINABLE ENERGY FOR ALL

ASSESS THE SITUATION

Decision Tree

Is there an up-to-date National Electrification Strategy?

Yes

Are stand-alone systems and mini-grids integrated in the National Electrification Strategy (NES)?

Yes

Review policy and regulatory framework to reflect NES

Mini-grid

- Determine mini-grid ownership and operator model.
  - Utility operator model
  - Private operator model
  - Community operator model
  - Public-private operator model
- Establish MG policy instruments and regulations
  - Establish regulatory framework reflecting mini-grids operator models
  - Licensing, permitting, tendering, concession and contractual regulation
  - Uniform national electricity tariff vs. cost reflective tariffs
  - Technical standards, quality of service regulations and reporting mechanisms
  - Customer protection and environmental policy and regulation
  - Regulations for interconnection with the national grid
- Public funding for mini grids
  - Financing mini-grids
  - Private funding for mini grids
- Strategies for community engagement and the promotion of productive use of electricity
- Mainstreaming gender in mini-grid

Standalone Systems

- Collaborate with the private sector to promote off-grid electrification
- Technical quality standards and consumer protection
- Introduce fiscal incentives and financial tools
- Promote private investment
- Promote local capacity building for deployment, installation and maintenance
- Launch public information and awareness campaigns
- Promote the development of local supply chains
- Promote repair and recycling infrastructure and regulations

No

Develop or update National Electrification Strategy (NES)

No

Carry out Integrated Electrification Planning (IEP)

- Define electricity access levels using the multi-tier framework
- Establish a coordinating body empowered with high-level political buy-in
- Engage experts and relevant stakeholders
- Collect data and use tools (e.g. GIS) to support rural electrification planning
- Estimate potential of mini-grids and off-grid systems
