SUSTAINABLE ENERGY FOR ALL

Powering Healthcare

ASSESS THE SITUATION

Decision Tree

Is healthcare addressed in the national electrification plan/ strategy?

- **Yes**
  - Develop enabling framework conditions for powering healthcare
    - Data collection and analysis
      - Understand impact data and nexus between sustainable energy,health and other dimensions (e.g. gender,climate change, jobs)
      - Plan and collect relevant data and analyse current energy access rates of healthcare facilities
      - Assess energy needs of healthcare facilities
        - General power and energy requirements
        - Cold chain power and energy requirements
        - Non-cold chain related thermal energy requirements
      - Select suitable tools (e.g., GIS) to support data collection and analysis for electrification planning
      - Assess supply technology option based on locations, cost and other parameters to electrify healthcare facilities
        - Identify suitable locations for grid extension and densification options
        - Identify suitable locations for mini-grids / stand-alone systems
    - Policy, Planning and institutional framework for implementation
      - Nominate a coordinating body with high-level political buy-in (e.g. under Ministry of Health or Ministry of Energy)
      - Prioritize healthcare facility electrification in social and development policies
      - Establish domestic and international partnerships and multistakeholder platforms for powering healthcare, including funding and technology
      - Develop supporting policies and accountability mechanisms
      - Develop and/or adjust regulatory framework to address the multi-dimensionality of electricity supply and ensure accountability
      - Define and integrate energy and health indicators
      - Develop procurement guidelines
      - Establish a data platform and remote monitoring system for decision-making and monitoring implementation progress
      - Build institutional capacity for powering healthcare facilities
    - Technical aspects to be considered for policy and regulations
      - Technical standards for healthcare electrification
        - System sizing
        - System components
      - Further technology considerations
        - Energy efficiency and demand side management
        - Appliances
        - Thermal energy
        - Energy storage
      - Operation and maintenance
      - Climate resilience in healthcare facilities
      - Recycling of decentralized energy system components
    - Financial
      - Identification of investment needs and financing gaps based on new or revised national electrification strategy and healthcare components
      - Determine suitable financing models for healthcare electrification
        - Domestic public funding
        - Blended finance
        - Private sector finance
        - International funding sources
- **No**
  - Include electrification of healthcare facilities in national electrification strategy / plan
